The New York State Department of Health (NYSDOH) collects, compiles, and analyzes information on influenza activity year round in New York State (NYS) and produces this weekly report during the influenza season (October through the following May).¹

During the week ending November 24, 2012:

- Influenza activity level was categorized as widespread.²
- Laboratory-confirmed influenza was reported in 34 counties plus New York City. There were 494 total reports, a 65% increase over last week.
- Eight of 26 specimens submitted to the NYSDOH laboratory were positive for influenza. All were influenza A (H3).
- Reports of percent of patient visits for influenza-like illness (ILI³) from ILINet providers was 1.49%, which was below the regional baseline of 2.0%.
- The number of patients admitted to the hospital with laboratory-confirmed influenza or hospitalized patients newly diagnosed with laboratory-confirmed influenza was 26, a 44% increase over last week.
- There were no influenza-associated pediatric deaths reported this week.

Laboratory Reports of Influenza (including NYC)

All laboratories that perform testing on residents of the state report all positive influenza test results to NYSDOH.

Based on laboratory reports to NYSDOH:
- Influenza was reported in 39 counties this week.
- Influenza was reported in 5 counties previously this season, but not this week.
- Influenza has not yet been reported in 18 counties this season.

² No Activity: No laboratory-confirmed cases of influenza reported to the NYSDOH. Sporadic: Small numbers of lab-confirmed cases of influenza reported. Local: Increased or sustained numbers of lab-confirmed cases of influenza reported in a single region of New York State; sporadic in rest of state. Regional: Increased or sustained numbers of lab-confirmed cases of influenza reported in at least three regions but in fewer than 31 of 62 counties. Widespread: Increased or sustained numbers of lab-confirmed cases of influenza reported in at least 31 of the 62 counties.

³ ILI = influenza-like illness, defined as temperature ≥100°F with cough and/or sore throat in the absence of a known cause other than influenza.
Test results may identify influenza Type A, influenza Type B, or influenza without specifying Type A or B. Some tests only give a positive or negative result and cannot identify influenza type (unknown).

Influenza Virus Types and Subtypes (excluding NYC)

Wadsworth Center, the NYSDOH public health laboratory, tests specimens from sources including, but not limited to, outpatient healthcare providers (ILINet program) and hospitals (EIP program).

There are 2 common subtypes of Type A influenza viruses – H1 and H3. Each subtype has a slightly different genetic makeup from the other. Rarely, an influenza virus is unable to be typed by the laboratory.
**Influenza Antiviral Resistance Testing**
The Virology Laboratory at the Wadsworth Center performs surveillance testing for antiviral drug resistance in influenza viruses. The laboratory has not tested any specimens for antiviral resistance yet this season. Information will be updated in subsequent weekly reports.

Additional information regarding national antiviral resistance testing, as well as recommendations for antiviral treatment and chemoprophylaxis of influenza virus infection, can be found at [http://www.cdc.gov/flu/weekly/](http://www.cdc.gov/flu/weekly/).

**Outpatient Doctor’s Office Visits for ILI - ILINet Surveillance Program (excluding NYC)**
The NYSDOH works with ILINet healthcare providers who report the total number of patients seen and the total number of those patients with complaints of ILI every week.

![Percent of Influenza-like Illness (ILI) based on total ILINet Provider Patient Visits for NYS by week, 2011-12 to Present](chart1.png)

The CDC uses trends from past years to determine a regional baseline rate of doctors' office visits for illness consistent with influenza. For NYS, the regional baseline is currently 2.0%. Numbers above this regional baseline suggest high levels of illness consistent with influenza in the state.

**Emergency Department Visits for ILI - Syndromic Surveillance (excluding NYC)**
Hospitals around NYS report the number of patients seen in their emergency departments with complaints of ILI. This is called syndromic surveillance.

![Percent of Weekly Emergency Department Visits for Influenza-like Illness By Region, Previous 52 Weeks](chart2.png)

An increase in visits to hospital emergency departments for ILI can be one sign that influenza has arrived in that part of NYS.

Visits for symptoms including fever plus sore throat or cough are counted. Syndromic surveillance does not reveal the actual cause of illness, but is thought to correlate with emergency department visits for influenza.
Patients Hospitalized with Laboratory-Confirmed Influenza (including NYC)
Hospitals in NYS and NYC report the number of hospitalized patients with laboratory-confirmed influenza to NYSDOH.  

Underlying Health Conditions among Hospitalized Patients
As part of the CDC’s Influenza Hospitalization Network, the NYS Emerging Infections Program (EIP) conducts enhanced surveillance for hospitalized cases of laboratory-confirmed influenza among residents of 15 counties. Medical chart reviews are completed on all identified cases from October 1 through April 30 of the following year.

Selected Underlying Medical Conditions in Patients Hospitalized with Influenza, October 1, 2012 - November 24, 2012

4 127 (60%) of 213 hospitals reported this week.
5 Counties include, in the Capital District: Albany, Columbia, Greene, Montgomery, Rensselaer, Saratoga, Schenectady, and Schenectady; in the Western Region: Genesee, Livingston, Monroe, Ontario, Orleans, Wayne, and Yates.
Healthcare-associated Influenza Activity (including NYC)
Hospitals and nursing homes in New York State self-report outbreaks of influenza. A healthcare-associated outbreak of influenza is defined as one or more confirmed or two or more suspect cases in persons who were admitted to the facility with no signs or symptoms of influenza infection; that is, influenza infections acquired within the facility. Outbreaks are considered confirmed only with positive laboratory testing. This may include a positive rapid antigen test if no other more advanced testing (polymerase chain reaction, viral culture) is performed. Outbreaks are reported based on the date of onset of symptoms in the first identified case.6

ACF = Acute Care Facilities  
LTCF = Long Term Care Facilities

Outbreaks are reported according to the date of onset of symptoms in the first case.
