perform lifting, carrying, and reaching overhead, and also may seriously affect your ability to perform activities requiring fine movements. We evaluate these limitations under 114.05A.

5. **Undifferentiated and mixed connective tissue disease (114.06).**

a. **General.** This listing includes syndromes with clinical and immunologic features of several autoimmune disorders, but which do not satisfy the criteria for any of the specific disorders described. For example, you may have clinical features of SLE and systemic vasculitis, and the serologic (blood test) findings of rheumatoid arthritis. The most common pattern of undifferentiated autoimmune disorders in children is mixed connective tissue disease (MCTD).

b. **Documentation of undifferentiated and mixed connective tissue disease.** Undifferentiated connective tissue disease is diagnosed when clinical features and serologic (blood test) findings, such as rheumatoid factor or antinuclear antibody (consistent with an autoimmune disorder) are present but do not satisfy the criteria for a specific disease. Children with MCTD have laboratory findings of extremely high antibody titers to extractable nuclear antigen (ENA) or ribonucleoprotein (RNP) without high titers of anti-dsDNA or anti-SM antibodies. There are often clinical findings suggestive of SLE or childhood dermatomyositis. Many children later develop features of scleroderma.

6. **Inflammatory arthritis (114.09).**

a. **General.** The spectrum of inflammatory arthritis includes a vast array of disorders that differ in cause, course, and outcome. Clinically, inflammation of major joints in an upper or a lower extremity may be the dominant manifestation causing difficulties with walking or fine and gross movements; there may be joint pain, swelling, and tenderness. The arthritis may affect other joints, or cause less limitation in ambulation or fine and gross movements. However, in combination with extra-articular features, including constitutional symptoms or signs (severe fatigue, fever, malaise, involuntary weight loss), inflammatory arthritis may result in an extreme limitation.

b. **Inflammatory arthritis involving the axial spine (spondyloarthropathy).** In children, inflammatory arthritis involving the axial spine may be associated with disorders such as:

   (i) Reactive arthropathies;
   
   (ii) Juvenile ankylosing spondylitis;
   
   (iii) Psoriatic arthritis;
   
   (iv) SEA syndrome (seronegative enthesopathy arthropathy syndrome);
   
   (v) Behçet's disease; and
   
   (vi) Inflammatory bowel disease
